During the past ten years, great advances have been made in the area of plant molecular biology. Such formerly esoteric techniques as gene transfer and plant regeneration are now routinely performed, making the dissection of regulatory elements of genes a common practice in many laboratories. Along with this new technology has come an almost bewildering array of rapidly changing techniques, often making it difficult for the novice to select and perform the technique most appropriate for answering a given biological question. In 1986, some of us felt that many of these techniques had become routine enough to warrant the publication of a laboratory manual. The manual is designed both for advanced college level laboratory courses and as a 'bench guide' for use in the scientific laboratory. Recognizing the rapidly changing nature of plant molecular biology technology, the editors have designed a laboratory manual that is both easy to use in the laboratory and which will be updated as the techniques change and new technologies are devised. Additional chapters that can replace or be added to this first edition will be published periodically. The

editors recognize that many of the techniques described in this manual depend upon specialized plant genetic material, microbial strains, or recombinant plasmids. Those people desiring such material should contact the relevant authors directly. A list of the various contributors to this manual, including their addresses, is included.

Improving the safety for blood and blood product transfusion It is amazing that in the first years of the 21st century there are insufficient blood supplies and that some supplies are unsafe in certain areas of the world. Regulations and codes call for continuous improvement in processes and attitudes to assure safety everywhere. To that end nearly 200 transfusionists and their colleagues gathered in Sydney in October 2005 to conduct a marathon symposium on methods and advances made towards achieving universal safety for blood and blood product transfusion. Sponsors of the latest products joined in to support this extraordinary meeting of information and ideas. Advances in transfusion safety were put forward from all areas of the blood transfusion process, including establishment of services, donor selection, infections that may affect donors, safe testing, risk and safety assessment, the roles of government and regulation, the use of blood and its products as well as the need for effective communication. The resulting papers from internationally renowned experts are published in these proceedings.
